

A/B/G/P Pre-Freeze Methodological Qualification - v1

This document is retained for audit history. It should not be used as a freeze-ready qualification report.

Why superseded:

The original headline QUALIFIED was too broad. The completed checks qualified statistical code, synthetic fixtures, replay, and the DEV/QUAL safety boundary. They did not qualify the complete end-to-end experimental implementation. In particular, B still contained development placeholders, and the A/P power figures did not cover the complete multi-control PASS event.

Confirmatory status: no confirmatory run occurred; the confirmatory namespace remained untouched.

Use the replacement review package:

ABGP Pre-Freeze Design & Implementation Review v2

Same scientific criteria; corrected implementation-status and power interpretation; Bill Bao's 17 September review points recorded as explicit pre-freeze blockers.

The original v1 figures are preserved in repository history for provenance. This superseding notice is a reporting correction, not a change to the preregistered scientific hypotheses, effect floors, or confirmatory criteria.
