

A/B/G/P Pre-Freeze Methodological Qualification

Metalogic Labs review candidate - qualification of the experiment mechanics only, not confirmatory scientific evidence.

Status: QUALIFIED Confirmatory namespace used: 0 Full regression: 200/200 tests

Current review candidate

Arm	Inferential unit / dependence	N	Floor	Min power
A	Independent acquisition -> sealed-future episode	4,096	5 pp	0.825254
B	Ordered-direction world; 4 interventions nested	1,015 / direction 12,180 total	15 pp	0.800598
G	Independent world; all doses jointly blocked	421	15 pp	0.801242
P	Independent acquisition -> restart -> future episode; 4 fixed probes collapse to one episode outcome	4,096	5 pp	0.825254

What changed before freeze

A: same acquisition information for fixed-language Bayes; one non-identifying message; independently seeded sealed future; no future verifier. **B:** 12 ordered grammar directions are separate strata; the arm is an intersection-union test over 12 directions x 3 controls = 36 components; arm p-value is the maximum component p-value. **G:** one relevance-label exchange per world is applied jointly across all doses; the exact world-blocked DP was cross-checked against brute-force sign enumeration. **P:** one independently seeded acquisition per inferential unit; serialize -> hard restart -> four fixed future probes -> one binary episode outcome; nested probes never inflate N.

Power provenance

The larger counts were not chosen in response to a weak DEV effect. They come from a pre-freeze qualification rule: at least 80% power at the preregistered minimum effect floor over the full feasible discordance envelope, using component alpha = 0.0125. B uses a dependence-agnostic union-bound lower bound for simultaneous success of all 36 IUT components. G assumes zero signal at lower doses and powers only from the maximum-dose floor.

Qualification evidence

Frozen fixtures	21 total: 4 planted-positive, 13 ordinary-explanation, 4 broken-mechanics
Fixture result	All 21 matched their preregistered expected verdict
Independent statistical reference	PASS - McNemar, Holm, legacy G DP, and world-blocked G DP cross-checks
Qualification digest	e1e01c892e1006bc68b507865a429a733a168cb3156e57815ba57dac6c6a9206
Qualification JSON SHA-256	4e69329d127381661cc6ce49ffdbecc5c84e621efe0ba7efdbbd43d81517bcf

Review target: Please attack the inferential-unit definitions, dependence assumptions, and power calculations before freeze - especially any hidden shared ancestry in A/P, the B IUT construction, or the G world-level exchangeability argument.

The design remains REVIEW_PENDING and confirmatory execution remains disabled. A later confirmatory run would be a separate event and is not represented by this document.
